

NEXUS WMS – Enterprise Warehouse Management System

End-to-End Operational Workflow (Client Overview)

System Overview

NEXUS WMS is a multi-tenant Warehouse Management System (WMS) that manages the complete inventory lifecycle—from supplier procurement and warehouse receiving to customer order fulfillment and shipping. The platform provides real-time inventory visibility, batch/lot tracking, expiry management (FEFO), warehouse operations, and a self-service client portal.

User Roles

Super Admin

- Create and manage companies, warehouses, and users.
- Configure system settings and role permissions.
- Monitor platform activity, audit logs, and reports.

Warehouse Manager

- Manage warehouse operations.
- Create products and purchase orders.
- Onboard B2B clients and warehouse staff.
- Monitor inventory, approve operations, and generate reports.

Inventory Clerk

- Receive incoming goods.
- Perform quality checks.
- Assign batch/lot numbers and expiry dates.
- Store inventory in warehouse bins.
- Pick, pack, and dispatch customer orders.

B2B Client

- Browse product catalog.
- View available inventory.
- Place sales orders.

- Track shipments.
 - Download COA (Certificate of Analysis) documents.
-

Operational Workflow

Step 1 – User & Client Setup

The Super Admin creates companies and warehouses. Warehouse Managers then create Inventory Clerk accounts and onboard B2B Clients with secure login credentials.

Step 2 – Product Management

Warehouse Managers create product master records including SKU, barcode, pricing, storage type, and unit of measure. These products become available for purchasing and order processing.

Step 3 – Purchase Order & Goods Receiving

Warehouse Managers create Purchase Orders for suppliers. When goods arrive, Inventory Clerks receive the shipment, verify quantities, record damaged items (if any), assign batch/lot numbers and expiry dates, then store inventory in designated warehouse bins.

Step 4 – Warehouse Operations

Inventory is transferred from receiving areas to permanent storage locations. Stock movements, adjustments, and cycle counts are recorded to maintain inventory accuracy.

Step 5 – Client Sales Orders

B2B Clients log into the Client Portal, browse available products, and place sales orders. The system validates stock availability in real time and prevents orders exceeding available inventory.

Step 6 – Picking & Packing

Approved orders are automatically allocated using the FEFO (First Expired, First Out) method. Inventory Clerks pick products from assigned warehouse bins, pack the items, and prepare them for shipment.

Step 7 – Shipping & Delivery

Shipping labels and tracking numbers are generated automatically. Orders are dispatched through the selected logistics carrier, and shipment status is updated in real time.

Step 8 – Client Portal

Clients can monitor inventory, track order status, view shipment progress, and download COA documents for delivered batch lots.

Key Features

- Multi-Tenant Warehouse Management
 - Purchase & Sales Order Management
 - Batch, Lot & Expiry Tracking
 - FEFO Inventory Allocation
 - Warehouse Bin Management
 - Real-Time Inventory Visibility
 - Client Self-Service Portal
 - Shipment Tracking
 - Role-Based Access Control (RBAC)
 - Complete Audit Trail
-

Business Flow Summary

Company Setup → User Creation → Product Setup → Purchase Order → Goods Receiving → Batch & Expiry Assignment → Warehouse Storage → Client Order → FEFO Picking → Packing → Shipping → Delivery → Client Tracking

This workflow ensures complete inventory traceability, operational efficiency, and accurate warehouse management from inbound receiving to final customer delivery.
